

# **Matt Alfano and Brittany Masi**

Frito Lay Representative: Jeff Arndt Replenishment Manager

#### **Management Summary**

The opportunities presented to us for our Senior Design project include: Design and create out of stock tools that are very user friendly and are able to historically scan data while predicting inventory shortfall @ Club/SKU level. More features of this project include determining what Inventory is needed by Club/ SKU and determine Delivery Frequency by Club.

We decided that only these opportunities fell into the scope of our project. After consolidating all of the available information into one database we cleaned some of the unnecessary tables out so that it would increase the efficiency of us analyzing the Spy Reports that can be generated on any product by their current database queries. We only analyzed two of the highest demanded product lines that Frito Lay current keeps in stock at Sam's clubs nationwide. These two products are Smart Mix and Variety Mix.

We created a Seasonal Adjustment and Linear Exponential Smoothing model into an excel file that could automatically do every club's analysis. This gave us extreme flexibility and had the best potential for creating a very user friendly tool that could automatically change based on a drop down box connected to each Sam's Club Number and corresponding Sales data. Anyone could copy and paste the sales data given in any Spy Report by product line into the first tab and have instant analysis at the touch of their fingers.

#### **Background and Description of the Problem Situation**

#### Frito-Lay North America

Frito Lay is a division of PepsiCo, the leading convenient food and Beverage Company in North America. Frito-Lay is PepsiCo's largest North American division. FLNA makes, markets, sells and distributes branded snack foods. These foods include Lay's potato chips, Doritos tortilla chips, Cheetos cheese flavored snacks, Tostitos tortilla chips, branded dips, Fritos corn chips, Ruffles potato chips, Quaker Chewy granola bars and SunChips multigrain snacks. FLNA branded products are sold to independent distributors and retailers. In addition, FLNA's joint venture with Strauss Group makes, markets, sells and distributes Sabra refrigerated dips. FLNA's net revenue was approximated 31% of its total net revenue during the fiscal year ended December 26, 2009 (fiscal 2009). Frito Lay is the leading convenient foods company in North America. They have control of roughly 65% of the salty snack market. They have No. 1 brands in categories ranging from potato chips to tortilla chips to corn chips to snack bars. Frito Lay generates \$11 billion in annual sales. They have more than 48,000 Frito-Lay associates across every state and Canada, including more than 30 plants and more than 16,000 sales routes.

Frito Lay is headquartered in Plano, Texas, right outside Dallas. Frito Lay has a rich 70-year history: Frito Company founded in 1932, Lay's introduced in 1938, H.W. Lay and Frito companies merged in 1961, Frito-Lay and Pepsi-Cola merged to form PepsiCo in 1965. Frito Lay makes, move and sell their products "from seed to shelf."

They contract with farmers to produce patented varieties of corn and potatoes to ensure the highest-quality ingredients. They have 30+ plants and 200 distribution centers

across the U.S. and Canada. They have one of the largest private fleets in North America. They have a virtually unrivaled distribution system that enables us to differentiate their products in the marketplace. Frito Lay is known for their "Direct Store Delivery" System the largest DSD system in North America. Frito Lay delivers their chips directly to stores to ensure freshness and merchandize themselves, which gives us a tremendous competitive advantage in the marketplace. Their go-to-market system also includes warehouse distribution, giving us additional flexibility that helps drive their strong partnerships with their customers.

#### Sam's Club Representative

Matt contacted the Sam's Club Representative Jeff Arndt at Frito Lay Headquarters to see if he had a Senior Design Project for us to work on. He presented us with a cluttered outdated database and OOS tools that were difficult to understand and analyze.

### **Opportunities presented:**

- 1. Revamp / Design existing Out of Stock Tools
  - a. Make them user friendly
- 2. Using historical scan data predict inventory shortfall @ Club/SKU level
- 3. Determine what is the Inventory needed by Club/ SKU
- 4. Determine Delivery Frequency by Club
- 5. Solve for Negative Inventories

## **Project Goals:**

1. Establish database criteria using information obtained from OOS report and incorporating the DC/Bin/Plant Inventory and future Orders/ Shipments.

- 2. Design Canned Reports
- 3. Application functionality: Integration of Frito Lay and Wal-Mart Inc Data
  - a. Consolidate all into one Data Base / Server
  - b. Minimize Human Intervention: Filters / Clean Data / Automation
  - c. Drop Data in server
    - i. Select Report
    - ii. Geo/National/Building

#### **Decision**

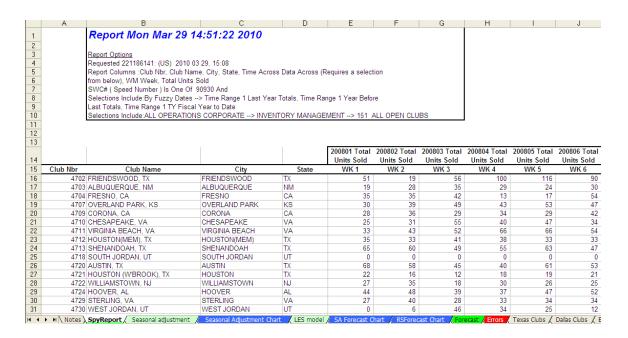

After being presented with all of these goals we met with Dr. Barr and he decided that only some of these points fell into the scope of our project. The main points we focused on were Opportunities #'s 1, 2, 3, and 4. After updating their databases and cleaning those out we were ready to analyze the Spy Reports that can be generated on any product by their current database queries.

We decided to work on the two highest demanded product lines that Frito Lay current keeps in stock at Sam's clubs nationwide. These two products are Smart Mix and Variety Mix. Smart Mix and Classic Variety Mix can be found below.

The current spy report that Regional Sales Representatives as well as Frito Lay Sam's Club representatives use can be found below.

We hoped to create a extremely user friendly analysis of all 597 Sam's club at the push of a button, so that any RSR(Regional Sales Representative), RSM (Regional Sales Manager) or Sam's Club representative could look at their weekly sales in a very visual and easily manageable tool.

#### **Analysis of the Situation**

Our first approach focused on using existing Time Series Forecasting tools offered by Dr. Barr. This allowed us to enter in which ever club's sales data we wanted to analyze.

Forecast based on trend and seasonal only Mean squared error for periods 27 through 88 = 8.619248

It was a pretty straight forward approach but was not efficient enough for us to use for all 597 clubs for both products. That would have involved a lot of manual importing and exporting that did not provide our audience with an efficient tool that could be used by everyone.

The next approach we took was using SAS in the economic department. It was very tedious and tiring processes that eventually lead us to try a new approach. We were able to get some useful weekly analysis regarding the Means procedure. This was our first attempt to analyze weekly trends in the data.

The SAS System

The MEANS Procedure

Variable	N	Mean	Std Dev	Minimum	Maximum

We discovered that the standard deviation remained high as the average mean increased. We also noticed that there were certain weeks that were on average significantly lower. At the end of the year the average sales data dropped dramatically, also certain weeks of the year had significantly lower max sales. There was slight confusion when we discovered negative sales; we were unable to discover the route of this error. We think that it may be because of human error.

Our last approach, which finally pointed us in the right direction, was creating a Seasonal Adjustment and Linear Exponential Smoothing model into an excel file that could automatically do every club's analysis. This would give us extreme flexibility and had the best potential for creating a very user friendly tool that could automatically change based on a drop down box connected to each Sam's Club Number and corresponding Sales data.

#### **Technical Description of the Model**

In order to perform the necessary seasonal adjustments and fit exponential smoothing models, we used a spreadsheet program, specifically, Excel. The screen images, charts and graphs below are taken from spreadsheets which have been set up to illustrate multiplicative seasonal adjustments and linear exponential smoothing on the sales data we received from Frito Lay.

The forecasting process has three main steps:

- 1. first the data was seasonally adjusted
- 2. then forecasts are generated for the seasonally adjusted data via linear exponential smoothing
- 3. finally the seasonally adjusted forecasts are "re-seasonalized" to obtain forecasts for the original series

The first step to create this seasonal adjustment is to compute a centered moving average. This can be done by simply taking the average of two one-year averages that are offset by one period relative to each other. The next step is to compute the ratio to moving average, which is the original data divided by the moving average in each period.

Moving Average: MA (4) = 
$$.25Y_{t}+.25Y_{t-1}+.25Y_{t-2}+.25Y_{t-3}+.25Y_{t-4}$$

The centered moving average and the seasonally adjusted data end up looking like this:

Note that the moving average typically looks like a smoothed version of the seasonally adjusted series.

The root mean squared average was created to analyze the error for the Linear Exponential Smoothing. The definition is located in the image above. Our Linear Exponential Smoothing model took into account the seasonally adjusted data as retrospect to the previous LES Error and alpha.

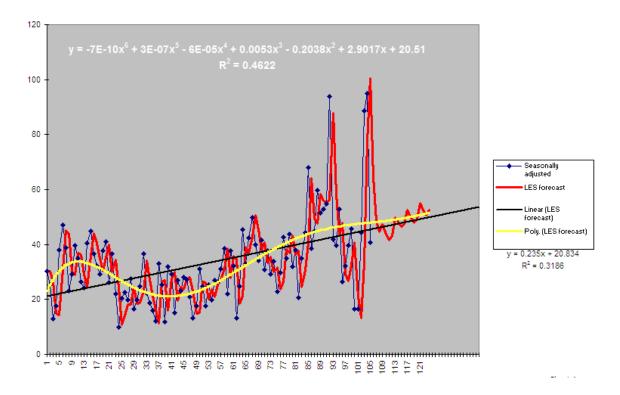

## **Analysis and Managerial Interpretation**

The following graph is the first tool that we have developed to analyze the original data of the Sam's club weekly sales for the specific Club Number and location. The seasonally adjusted graph seems to map over the original data entirely.

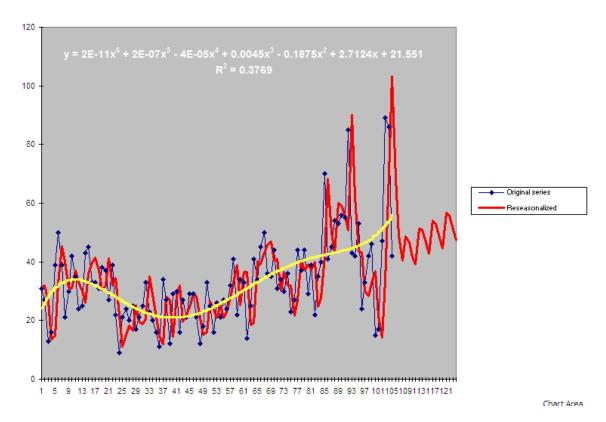

The moving average appears to be a less obtrusive way to look at the corresponding data. We can notice here that there appeared to be a large dip in the data weeks before each New Year. Some of these spikes are surges created from a specific event or holiday. Super bowl, New Year's, Labor Day weekend, Olympics, etc...

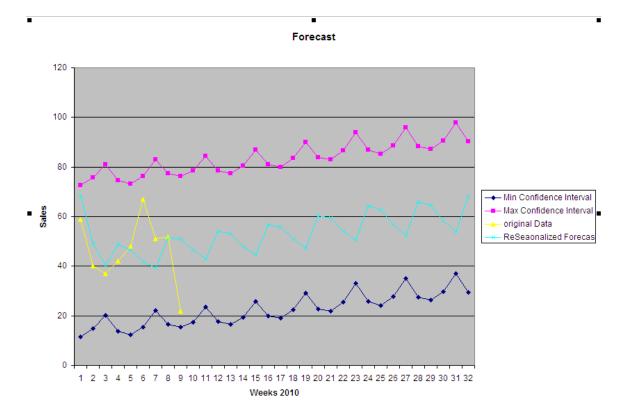

We noticed that the increase in audience for a specific show or sporting event on TV lead to an increase in weekly sales at Sam's Club. People tended to have more house parties and buy bigger bags of food that were typically sold at Sam's Club. We realized that most parties had a couple of Frito Lay products because they consumed the general majority of the Snack Industry. This gave us more variables to consider when doing our future forecast.

This graph leaves out the original data and compares the Seasonally Adjusted data to the Linear Exponential Smoothing data. We thought that we could better look at the trends if we incorporated a trend analysis as well as a polynomial trend analysis to the 6<sup>th</sup> order based on the LES Forecast.

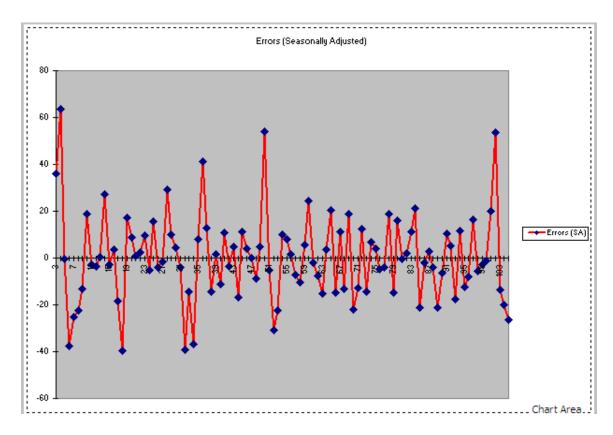

After re-seasonalizing the data we pushed out the horizon 3 weeks to see what its future forecast would look like. This was not the best graph to look at for future forecasting because it didn't have a direct comparison to the original data or the confidence intervals. This is why we created the below chart because it is very specific in its analysis purpose.

\*You can see our example of the spike in sales the week of the super bowl.

This graph accurately shows how our Reseasonalized forecast stays in between the confidence intervals. We also noticed that this club seemed to stay in the same intervals as well. We found this type of analysis most useful when comparing direct forecast accuracy to original data. As well as analyzing trends

The Errors graph measures the accuracy of the Seasonally Adjusted Data. This gave us a chance to manage the scope of our forecasts so that we could reduce our errors per week. It also allowed us to analyze the weekly trend and see if these weekly spikes were caused by an outside variable that needed to be calculated into forecast.

## **Managerial Interpretation**

On a managerial level, our analysis and findings, if taken seriously, can be used to help solve some of Frito Lay's current OOS issues that they are having with Sam's Club. Primarily, using the sales analysis' that we've created, Frito Lay managers, Sam's Club representatives, RSRs, RSMs, and anyone else in the replenishment department can access past sales data and get sales forecasts, complete with visual aids to help show relationships between data over trends of time. With this information readily available and extremely user friendly, product and/or sales reports can be created with the greatest of ease. Our findings will help Frito Lay set appropriate minimum inventory levels for specific SKUs at specific Clubs, and therefore hopefully avoid any further OOS fines. Along with establishing more efficient minimum inventory levels, proper delivery frequencies (by Club

and SKU) can also be calculated using the information provided by the analysis. To sum it all up, we found a way to process and analyze Frito Lay's past sales data and generate rather accurate forecasts and reports.

#### **Conclusions and Critiques**

As a whole, we found this project to be extremely successful and hopefully useful to Frito Lay. It is now easier for Frito employees to access and manipulate sales data in order to generate reports and forecasts. These forecasts, inside the confidence interval, will be very helpful when it comes to product replenishment. Appropriate individual (per SKU per Club) minimum inventory levels can be set for products that either sell out fast or stay on the shelf, so as to avoid fines by staying on top of local demand trends, which are not taken into account with the current inventory minimum of 11 units for all SKUs.

We think it would be greatly beneficial for Frito Lay to update their replenishment databases to the latest version of access. Their current version, which is 2003, is definitely something that will hurt them in the future. Technology is just going to keep advancing, and the only way to fully maximize their business potential is to have access to the best resources out there. We also recommend that Frito Lay keep farther back records of past sales data that they keep for analysis and forecasting. Currently they keep the past three years of data, which is what has been used for our forecasting models. However accurate these models are now, they would be more accurate, with more past data. Even keeping an additional two years, making the total five, would be a tremendous change.
