We may use *Elementary Row Operations* (ero's), to solve a system of linear equations or to move from one basic solution to another.

• Multiply any row of the matrix by a nonzero constant.

• Multiply any row, say *i*, by a nonzero scalar *c* and add the result to another row, say *j*.

For each column ℓ , replace matrix element $M_{j\ell}$ by $M_{j\ell} + cM_{i\ell}$ where M_{rc} is the element in row r, column c.!

Given a system of m linear equations with n variables $(n \ge m)$, a basic solution is found by setting n - m nonbasic variables equal to 0 and solving for the remaining m basic variables.

Note that the system of m equations with the m basic variables will either have a unique solution or no solution.

Example

$$z - x_1 - 2x_2 = 0 (1) x_1 + x_2 + s_1 = 4 (2) x_1 - 2x_2 + s_2 = 2 (3) -2x_1 + x_2 + s_3 = 2 (4)$$

Soln. Nonbasic Variables Basic Variables

1)
$$x_1 = x_2 = 0$$
 $s_1 = 4, s_2 = 2, s_3 = 2, z = 0$
2) $x_2 = s_1 = 0$ $x_1 = 4, s_2 = -2, s_3 = 10, z = 4$

3)
$$s_1 = s_3 = 0$$
 $x_1 = \frac{2}{3}, x_2 = \frac{10}{3}, s_2 = 8, z = \frac{22}{3}$

3

Using ero's to make x_1 a basic variable								
Add Row 1 to Row 0

	0	0	-3	-1	1	0	-2	(Row 2)
	0	0	3	2	0	1	10	(Row 3)

The pivot operation has two phases: first, we divide the pivot row by the pivot element. In this case, divide Row 3 by 3. In the second phase, we eliminate the variable in the pivot column from all rows except the pivot row. In this case, we want to "zero-out" the x_2 column (except for Row 3).

	Divide Row 3	by .	3.
